A freeloading parasitic will infect a helpless baby caterpillar with its eggs.
The eggs will then hatch and developed inside of the caterpillar.
The larvae when the time comes will pupate nearby.
The parasites will then tell the now grown caterpillar to stop eating,
And to remain close by so it can defend them from predators,
The caterpillar will die if need be to keep his parasitic alive
After the larva becomes full-grown,
And no longer needs the caterpillar
The parasitic eat the caterpillar alive
Without saying thank you
I pray you do not have parasites in your life
That eat your food while you defend them
Then when they no longer need you
Try to eat you, Prayers of Barry Wyatt Jr.
